Date	02 October 2026
Team ID	6ab636abdcdae33acb393f Fc1
Project Name	Implement Client Script & UI Policy (Incident)
Maximum Marks	2 Marks

Data Flow Diagram

Instruction: Create a Data Flow Diagram (DFD) to show how data moves through your system - between external entities, processes, and data stores. Use the symbol legend below as a guide.

Symbol	Name	Description
Oval	External Entity	A person or system outside the project (e.g., End User, Service Desk Agent)
Rectangle with numbered header	Process	An activity that transforms data (e.g., Validate Incident, Apply UI Policy)
Rectangle (solid)	Data Store	Where data is stored (e.g., Incident Table, CMDB)
Labeled arrow	Data Flow	Movement of data between entities, processes, and stores

Data Flow Diagram - Incident Form Validation

DFD Components Table:

Component	Type	Description
End User	External Entity	Submits incident records via ServiceNow form
Service Desk Agent	External Entity	Reviews, triages, and assigns incidents
1. Capture Incident Data	Process	Collects user input from the Incident form
2. Apply Client Scripts	Process	Executes onChange, onSubmit, onCellEdit scripts for validation and auto-population
3. Apply UI Policies	Process	Enforces field mandatory status, read-only status, and visibility rules
4. Save to Database	Process	Writes validated incident record to the Incident table
Incident Table [incident]	Data Store	Stores all incident records with validated data
CMDB	Data Store	Provides reference data for assignment groups and configuration items

Data Flow Table:

From	To	Data Description
End User	1. Capture Incident Data	Incident details (description, impact, category)
1. Capture Incident Data	2. Apply Client Scripts	Raw form field values
2. Apply Client Scripts	End User	Info messages, validation errors
2. Apply Client Scripts	3. Apply UI Policies	Validated/auto-populated field values
3. Apply UI Policies	Incident Form	Field state changes (mandatory, read-only)
3. Apply UI Policies	4. Save to Database	Policy-enforced field values
4. Save to Database	Incident Table	Complete incident record
CMDB	2. Apply Client Scripts	Reference data for validation
