Project Name:	Implement Client Script & UI Policy	**Maximum Marks:**	5 Marks

Project Initialization and Planning Phase

Project Proposal (Proposed Solution) report

Summary: This project aims to enhance Incident form usability and data integrity in ServiceNow by implementing client-side controls using UI Policies and Client Scripts. The solution addresses inconsistent data entry by enforcing conditional field behavior, auto-populating values, and preventing invalid submissions.

Project Details:

Section	Field	Content
Project Overview	Objective	Enforce data quality and consistent field behavior on ServiceNow Incident forms using UI Policies and Client Scripts, ensuring mandatory fields are populated, values are auto-set based on conditions, and invalid data is prevented at the point of entry.
	Scope	The project covers the Incident form in ServiceNow, implementing 2 UI Policies (mandatory enforcement, read-only control) and 3 Client Scripts (onChange for auto-population, onSubmit for save validation, onCellEdit for list view validation).
Problem Statement	Description	Incident records frequently contain incomplete or incorrect data because the standard form lacks client-side enforcement of business rules. Agents can submit high-impact incidents without assigning a technician or may set incorrect urgency values.
	Impact	Resolving these issues ensures SLA compliance, accurate reporting, faster incident resolution, and reduced manual rework for Service Desk agents.
Proposed Solution	Approach	Implement UI Policies to dynamically control field behavior (mandatory, read-only) based on Impact value, and Client Scripts to auto-populate fields, validate data on save, and enforce rules on list view edits.
	Key Features	- UI Policy: Make Assigned To mandatory when Impact = 1 (High). - UI Policy: Set Urgency to read-only and auto-set to High when Impact = 1. - onChange Script: Auto-populate Urgency based on Impact selection. - onSubmit Script: Prevent save if mandatory conditions are not met. - onCellEdit Script: Validate field values on list view edits.

Resource Requirements:

Resource Type	Description	Specification
Platform	ServiceNow Instance	Personal Developer Instance (PDI) - Washington/Xanadu release
Scripting	Client-side language	JavaScript
API	ServiceNow Client API	GlideForm (g_form), GlideUser (g_user), GlideList (g_list)
Development Tools	Script Editor	ServiceNow Studio / Built-in Script Editor
Browser	Testing Environment	Google Chrome with Developer Tools
Documentation	Reference	ServiceNow Developer Documentation, ServiceNow Community
